Gastrointestinal Cancers Symposium

### IDH1 mutations in advanced cholangiocarcinoma (CCA)

- CCA is a rare cancer for which there are limited effective therapies
- IDH1 mutations occur in up to 20% of intrahepatic CCAs,<sup>1</sup> resulting in production of the oncometabolite D-2-hydroxyglutarate (2-HG), which promotes oncogenesis
  - IDH1 mutations in CCA are not associated with prognosis<sup>1</sup>
- Ivosidenib (AG-120) is a first-in-class, oral, small-molecule inhibitor of mutant IDH1 (mIDH1)<sup>2</sup>
- The phase 3 ClarIDHy study aimed to demonstrate the efficacy of ivosidenib vs placebo in patients with unresectable or metastatic mIDH1 CCA<sup>3</sup>

α-KG = alpha-ketoglutarate; Me = methyl groups; NADPH = nicotinamide adenine dinucleotide phosphate hydrogen **1.** Boscoe AN, et al. *J Gastrointest Oncol.* 2019;10:751-765. **2.** Popovici-Muller J, et al. *ACS Med Chem Lett.* 2018;9:300-305. **3.** Abou-Alfa GK et al. *Lancet Oncol.* 2020;21:796-807.

#### ClarIDHy: Study design and endpoints

#### Key eligibility criteria

- ≥ 18 years of age
- · Histologically confirmed diagnosis of CCA
- Centrally confirmed mIDH1<sup>a</sup> status by NGS
- ECOG PS score 0 or 1
- 1-2 prior therapies (at least 1 gemcitabine- or 5-FUcontaining regimen)
- Measurable lesion as defined by RECIST v1.1
- · Adequate hematologic, hepatic, and renal function

#### NCT02989857

- Grade ≥ 3 TEAEs: 37.3% for placebo vs 53% for total ivosidenib
  - Most common grade ≥ 3 TEAEs<sup>c</sup> (placebo vs total ivosidenib): ascites (6.8% vs 9.0%), anemia (0% vs 7.2%), blood bilirubin increased (1.7% vs 5.4%)
- TEAEs leading to discontinuation were more common for placebo (8.5% vs 6.6%) than total ivosidenib
- TEAEs leading to dose reductions (0% vs 3.0%) and interruptions (18.6% vs 30.1%) were less common for placebo relative to total ivosidenib

<sup>a</sup>> 15% cutoff used for all grade TEAEs based on total ivosidenib
 <sup>b</sup>Total ivosidenib includes 43 patients initially assigned to placebo who had crossed over to ivosidenib upon radiographic disease progression and unblinding. All randomized patients as of 31May2020
 <sup>c</sup>> 5% cutoff used for grade ≥ 3 TEAEs based on total ivosidenib
 TEAE = treatment-emergent adverse event

Favors ivosidenib Favors placebo

- Subscales corresponding to physical functioning, pain, and appetite loss were prespecified in the statistical analysis plan.
   P-values were not adjusted for multiplicity
  - Ivosidenib preserved QLQ-C30 Physical Functioning<sup>b</sup> whereas placebo patients experienced decline from baseline at C2D1 (2-sided p = 0.002) and C3D1 (2-sided p = 0.004)
  - Ivosidenib was favored on the QLQ-C30 Pain<sup>c</sup> subscale at C2D1 (2-sided p = 0.039); no difference at C3D1
  - Neither arm was favored on other prespecified subscales (QLQ-C30 Appetite Loss<sup>c</sup> and QLQ-BIL21 Pain and Eating<sup>c</sup>, all 2-sided p > 0.050)

<sup>a</sup>At C2D1: n = 21 for placebo and n = 67 for ivosidenib (QLQ-C30); n = 20 for placebo and n = 65 for ivosidenib (QLQ-BIL21). At C3D1: n = 9 for placebo and n = 50 for ivosidenib (QLQ-C30); n = 9 for placebo and n = 48 for ivosidenib (QLQ-BIL21). All randomized patients as of 31May2020 <sup>b</sup>Higher scores denote better health status or function <sup>c</sup>Higher scores denote worse symptoms

C2D1 = cycle 2 day 1; C3D1 = cycle 3 day 1; LS = least squares; MMRM = mixed-effect models with repeated measurements

#### Conclusions

- ClarIDHy is the first randomized phase 3 study of a targeted, oral therapeutic with a noncytotoxic mechanism of action in advanced mIDH1 CCA
- Ivosidenib demonstrated a highly statistically significant improvement in PFS (HR = 0.37, 1-sided p < 0.0001) compared with placebo</li>
- Ivosidenib resulted in a numeric improvement in OS despite a high rate of crossover from the placebo arm (~70%), and this improvement was further supported by the RPSFT adjustment for crossover (HR = 0.49, 1-sided p < 0.0001)</li>
- The efficacy data coupled with a tolerable safety profile and supportive HRQOL data demonstrate the clinical benefit of ivosidenib in this aggressive disease in which there is an unmet need for new therapies

#### RPSFT method in clinical trials

- In ClarIDHy, placebo patients meeting crossover eligibility criteria upon radiographic disease progression were allowed to receive open-label ivosidenib,<sup>1</sup> causing the treatment effect estimate on OS to be confounded
- RPSFT models (developed in the 1990s) have been used for decades to adjust for the effect of treatment switching<sup>2-4</sup>
